2D Project Presentation – The Deep Blue

A Deep Sea Cross-platform Emulator

The goal of this game is to model, in a single-player game, the process of competing with different wildlife, represented as Non-Playable Characters, to reach a goal in the Game. You play as an octopus named Docker who is moving downwards in the game to a position where there is an opening to escape. At the end of the game, Docker is rewarded by moving out of the cage in the game and into *The Deep Blue*, an ever-expanding ocean. The goals and agenda get clearer the more the users play the game.

One-Section Summary:	For every round of the game, the player embarks on levels of the game. On each of these levels, the player is responsible for finding the exit in the level while avoiding obstacles in the game. Currents will blow the player who is an octopus back and forth. However, the player must avoid the currents from getting in the way of the player's target. The name of the player's character is Docker, and the game is called The Deep Blue.

Learning Objectives:

The goal of this game design is to process the game in a way that is improved. The game will be designed using an iMac 2013 – 2019 or a Mac Mini 2018. The goal will be to design all the attributes of the game during the game design process. We will evaluate the process of designing it and look for any differences in the game design process that should be addressed. The objective success of the game design for the characters is for the octopus and fish to be moving, as well as for a working current script to be present. The process of design can aid in our better understanding of the rules and norms of the game, as well as the teammates' better understanding of the norms of multilevel single-player game design. The goal of the game is to make a prediction based on the obstacles in the area and the current direction of the currents as to what will happen in the game.

Why does this work as a Classroom Activity:

- *Creates a gaming subculture backed by the dominant culture around game design.*

- *Allows different people to communicate about what their needs are in character development. Creates the game in a thought-provoking way.*
- *Allows students to get the chance to interact with the Burch Aquarium's wide range of life in a virtual environment.*
- *Creates a process for analyzing complex games and game design in a creative setting with working prototypes in less time.*

Game Design Structure:

---

1) **Materials:** Attain the required materials to construct the game.
2) **Model:** Create a real-life/virtual model of each of the scenes and the characters in the scenes.
3) **Challenges:** Create the obstacles that all the characters will have to go through to accomplish the plot of the story.
4) **Construct:** Construct all the levels of the game that are required for the character to succeed. Compose music for each level and the introduction of the game.
5) **Create:** Create a prototype of the game and the character and character artwork within the game. Create all the levels within the game.
6) **Obstacles:** Create the obstacle scripts with keyboard controls and music for different scenes within the game. Mouse can be used for analyzing tokens.
7) **UI:** Create the game UI and all the links and credits within the game, including the start menu.
8) **Publish and Market:** Publish the game and the source code of the game online. Market the game to the target audience of the game.

Game Play Process:

Enter the game through the start menu of the game. Then select the level of difficulty and the type of character you want to play as. You will be spawned as a character in a tank. Slowly falling downwards in the game. Move past obstacles and other characters while avoiding the currents in the game. Winners get the most points in the game. As you progress, the levels will increase in difficulty. The better you get in the game, the better your score within the game will be. The tokens you gather will improve your ability to win the game and will give you power-ups. The process of navigating the levels will give you more details on getting farther in the game. Multiplayer mode with racing will be added soon.
